PORTFOLIO WEBSITE GUIDE

Features, development approach, and how the page works

A quick overview

This is a single-page personal portfolio for T. Harshith, an aspiring web developer and first-year B.Tech Computer Science student. It introduces the owner, summarizes skills and education, presents a project, and provides a contact prompt. The page is built in one HTML file using semantic HTML and CSS; it does not use JavaScript or a server-side component.

What visitors can do

Navigate sections Use the top links to jump to About, Skills, Education, Projects, or Contact.	**Learn about the owner** Read the introduction, short biography, skill list, and education history.
Review a project See the Personal Portfolio Website entry and its HTML/CSS tags.	**Reach out** See a contact call-to-action that currently asks the owner to add an email address.

Page structure

The document follows the visitor journey from introduction to contact. The header contains the brand and section links. The main content contains six named sections: Home, About, Skills, Education, Projects, and Contact. A footer closes the page with a copyright line.

How it was developed

The supplied source is a standalone HTML document. The browser reads its structure and styles directly from the file. No build step, framework, JavaScript, or database is required for the current content.

1. HTML provides the content and structure

The file starts with standard document metadata, including UTF-8 character encoding, a mobile viewport setting, a page title, and a search description. Semantic elements such as **header**, **nav**, **main**, **section**, **article**, and **footer** give the content meaningful structure. Headings identify each section. Image alternative text and navigation labels help assistive technology describe the page.

2. CSS controls appearance and layout

A style block in the document defines the visual design. CSS custom properties hold shared colors; flexbox lays out the navigation and skill cards; grid spaces education entries; borders, shadows, and rounded corners create card styling. A centered content wrapper limits line length on wide screens. A mobile media query changes the navigation arrangement and spacing when the viewport is narrow.

3. Section links connect the page

Each navigation link points to an element ID, such as **#skills** linking to the section with **id="skills"**. The browser scrolls to that section without loading a new page. Smooth scrolling is enabled in CSS. The brand link returns to the Home section.

Responsive behavior

The design uses flexible widths, wrapping card layouts, and a breakpoint at 650 pixels. On smaller screens, the navigation becomes a vertical stack, section padding is reduced, and skill cards can resize and wrap to fit the available width.

How a visitor experiences it

When the file opens, the browser renders the header and introduction, then the sections in order. The visitor can scroll normally or choose a navigation link. Images are fetched from Unsplash over the internet, so the portrait depends on an active connection. All portfolio text and layout rules otherwise reside in the HTML file.

Current content and next improvements

The guide describes the supplied code as it exists. These notes identify content that appears intentionally unfinished or could be expanded.

What is already present

The page has a profile introduction, biography, five listed skills, three education entries, one project card, a contact section, and a copyright footer. It includes basic responsive styling, hover and keyboard-focus treatments for links and the button, descriptive image alt text, a navigation label, and section-heading associations for the Home section.

Details to complete

The contact area currently displays “Email: add your address” as a styled span, not a working email link. Replace it with the preferred address and, if desired, an anchor using a **mailto:** destination. The profile image URL points to a remote Unsplash image and can be replaced with a chosen portrait. Confirm the education dates and wording are accurate before publishing.

Ideas for a next version

• **Add real contact details:** update the placeholder and make the email action clickable.

• **Show working project links:** add a repository or live-demo link when available.

• **Improve image reliability:** use an owned image asset or provide a fallback if the remote image is unavailable.

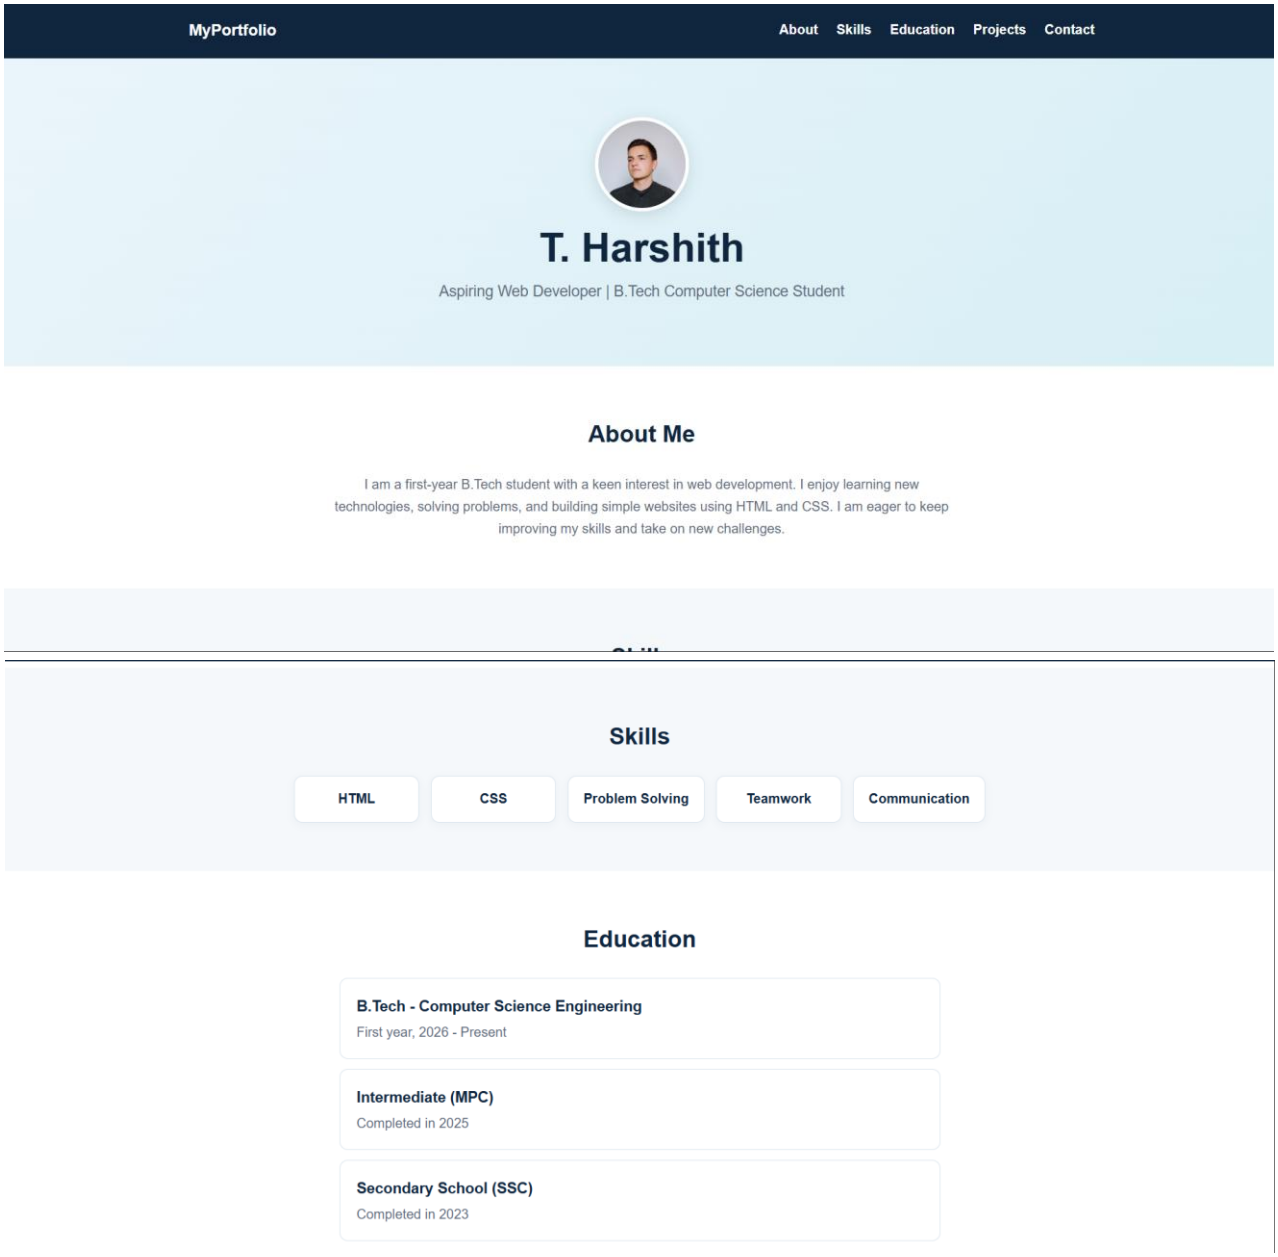

• **Check accessibility:** verify contrast, keyboard focus, heading order, and the page with a screen reader.

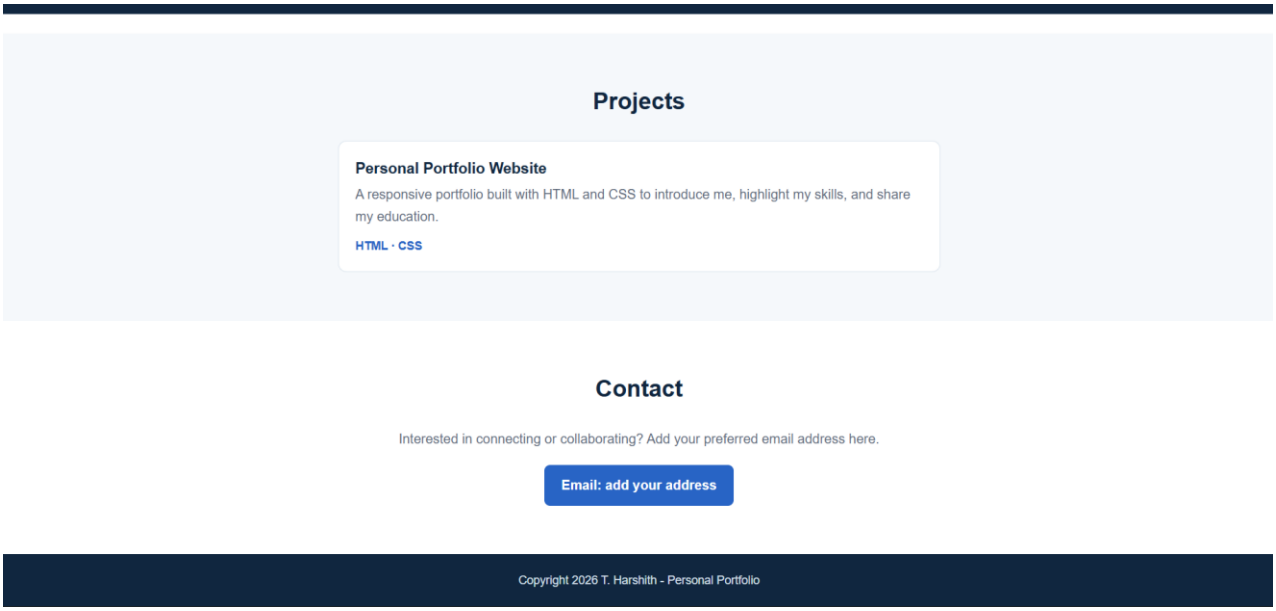

• **Publish the page:** host the HTML file on a static website service and test it on phone and desktop screens.

In summary

The portfolio is a lightweight, easy-to-read introduction page made with core web technologies. HTML organizes the content, CSS gives it a consistent visual design and responsive layout, and in-page links help visitors move between sections. The current contact details and project evidence are the main opportunities to make it more useful to visitors.
